Ordering Overview
Introduction

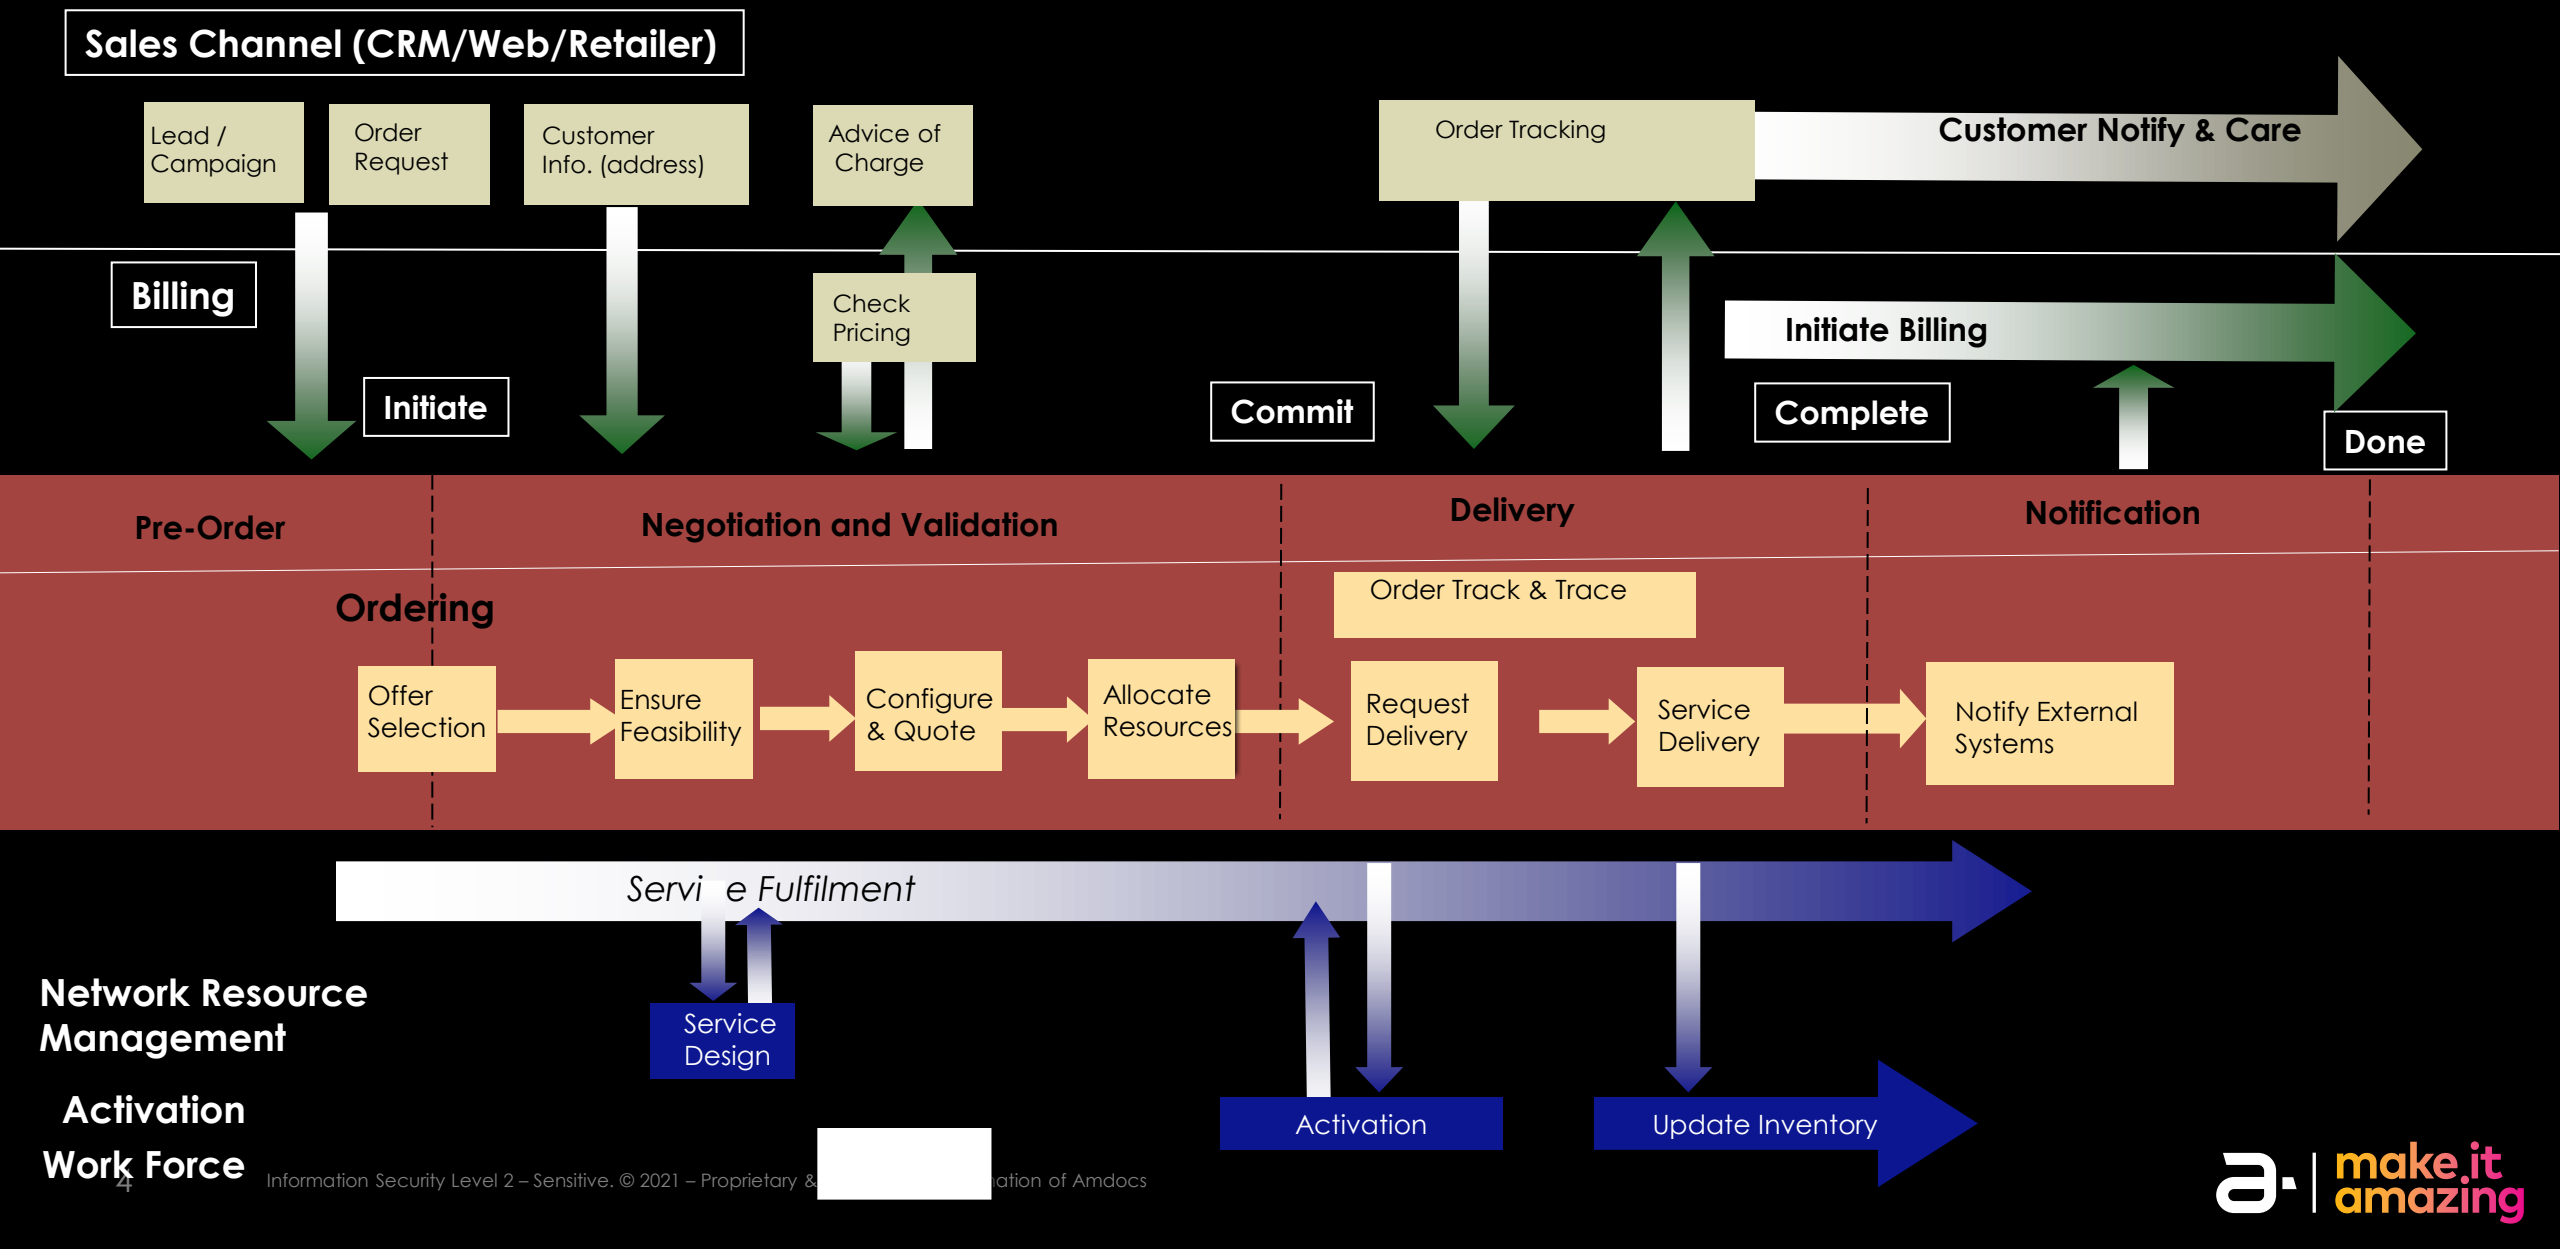

- Amdocs Ordering is a complete order management application that automates the entire ordering process

- Works through the complete ordering flow from negotiation to delivery and completion.

- Provides an overall solution to communications service provider (CSP) for all ordering activities across the full spectrum of wireline, wireless, cable, and convergent products and services in a single integrated environment.

Ordering Overview
Ordering Phases

- The ordering process consists of the activities of three separate phases

  - **Negotiation** – Collects all the information that is required to successfully fulfill the order action. The negotiation can be an interactive dialog between the CSR and the customer, or it can run in the background as data is received from external channels.

Ordering Overview
Ordering Phases

- **Delivery –** Fulfills the order action. The tasks in this phase are generally performed by external systems or back-office users. Once an order reaches the Delivery stage, it can no longer be negotiated.

- **Completion** – Notifies external systems when the order is completed and updates the current state of the product. External systems include billing, Customer Relationship Management (CRM), document shipment systems, and other operators and service providers.

Ordering Overview
Order Action

- An order action defines the product or service that the customer requests and the operation that has to be performed on that product or service (such as Provide or Change). Each order action relates to a predefined ordering process and consists of several steps.

- An order action is always included within an order

Ordering Processes

- Business flows of activities, launched when executing an order action

- Process definition should be defined for each order action type, for example :
  - Provide
  - Change
  - Cease
  - Suspend
  - Resume

Product Offering

- A marketable group of products (or single product) that a CSP offers to its customers.

- A Product offering has four main characteristics
  - The salable entity – business perspective of the product or service
  - Assembled from product specs
  - May include additional price plans, commitment terms and eligibility rules
  - May refine the product spec configuration
    - For example, an optional feature within the product spec configuration may be mandatory for that product offering.
